## Description

Biopower Industries offers modern renewable energy solutions. Our gasification equipment converts biomass into a combustible gas – producer gas, then further to electricity and heat, thus, ensuring Your energetic independence! Operating since 2005, in cooperation with subcontractors, we design, manufacture, install and maintain small cogeneration power plants, utilizing biomass, biogas, natural gas, and petroleum gas as its feedstock. Over the past years, the company has constantly evolved and improved its cogenerative power plant. We provide a broad range of services, guaranteeing an excellent result and a positive effect on your company's energy balance! Producing energy from biomass has both environmental and economic advantages. The alternatives to fossil fuel reduce emissions and greenhouse effect, as well as dependence on unstable fossil fuel market and the electric grid. Our aim is to encourage more and more companies to take advantage of this type of power generation.
