Description

Gait trainer Gait trainer EIK is a body balance maintenance system with leg control (gait training) mechanism that is intended for support and movement therapy used in medical rehabilitation and physical training of the disabled. Gait trainer EIK is intended for people with static and dynamic balance and movement disorders, after injuries, surgeries, strokes or other health disorders. The construction of the equipment is adjusted to start safe rehabilitation in the very early stage of the treatment. Gait trainer EIK easily adjusts physical capabilities of the patient and helps him in self-motion. The leg control mechanism is designed according to the biomechanical principles of human gait and allows to perform correct walking movements. The equipment has been developed in close cooperation with scientists from the medical, body training, sports and textile fields, as well as considering the remarks of people who used the trainer.
