Description

Direct Machining Control provides control software for laser machines. It is an all-in-one solution where the user creates or imports CAD objects, sets process parameters and clicks Run. DMC takes care of all the hardware control according to the recipe. Typical applications range from laser marking or engraving to 3D printing and 5-axis texturing of freeform surfaces. Using DMC's machine vision, sensor integration and various built-in tools for specific processes the user can quickly assemble a recipe for almost any task. All this allows researchers to focus on the actual research and manufacturers on delivering complete OEM solutions much faster.
